

# Project 3A

Taylor Nelms and Nikhil Shenoy

November 2, 2018

## 1 How to Run

You can run this project by executing “python mymosaic.py” from the command line. The script expects that the images being used for the mosaicing are in a directory one level higher than “mymosaic.py” and in a directory called “test\_img”. If you are in the same directory as “mymosaic.py”, then the relative path would be “../test\_img/1L.png”. Place three images in that “test\_img” directory. To do a nearest neighbors calculation, we used the KDTree from `scipy.spatial`.

## 2 Image Outputs

Figure 1: ANMS for the left image

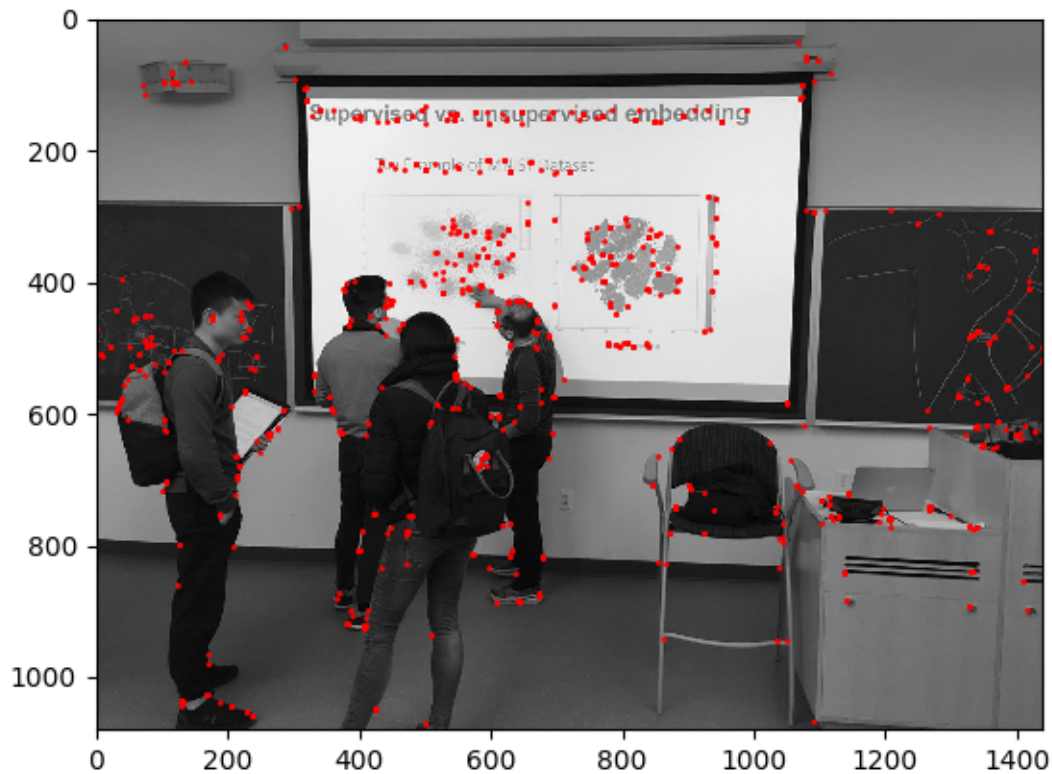

Figure 2: ANMS for the middle image

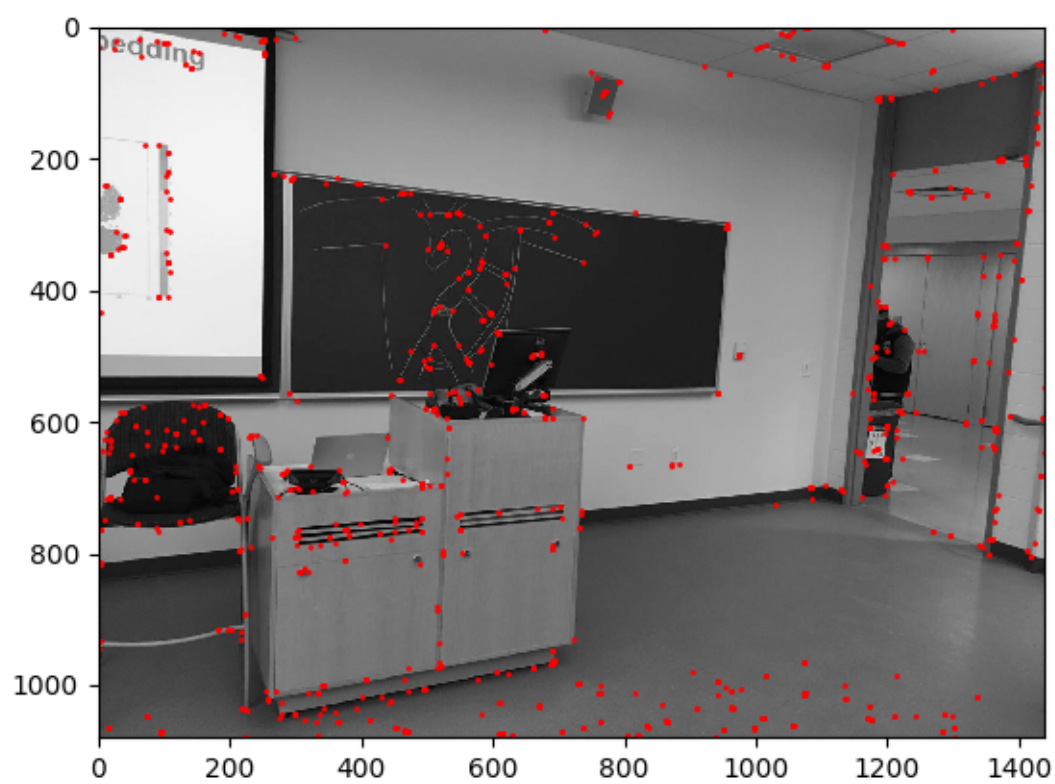

Figure 3: ANMS for the right image

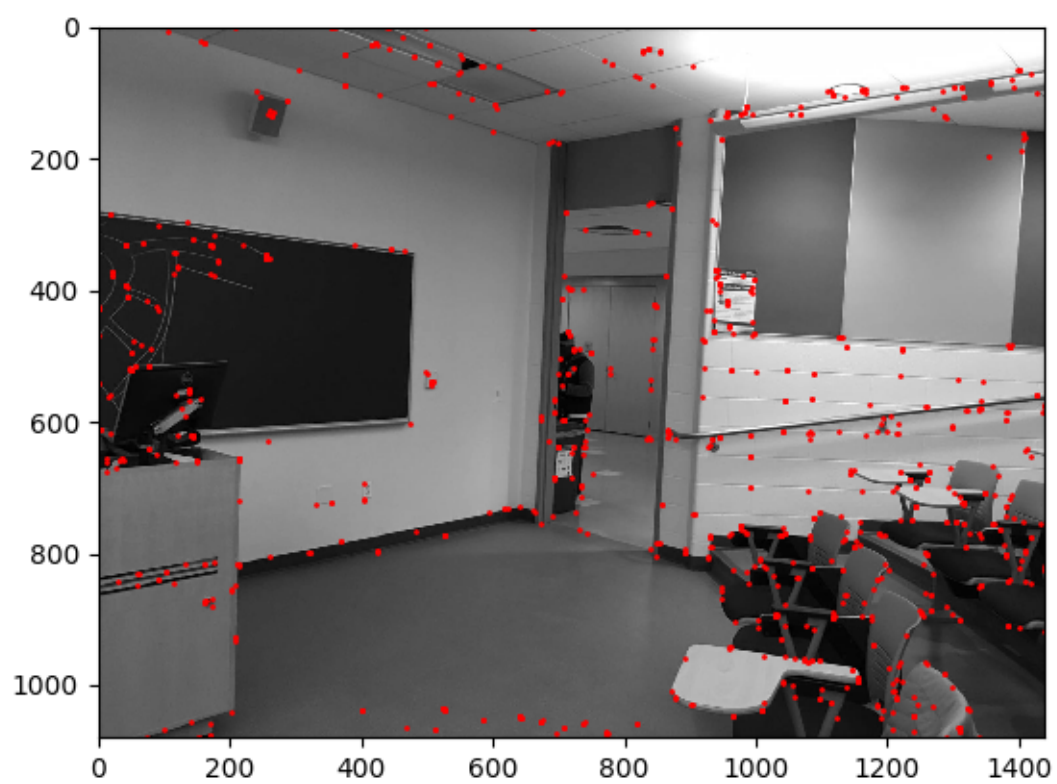

Figure 4: Post-RANSAC points using the left and middle images

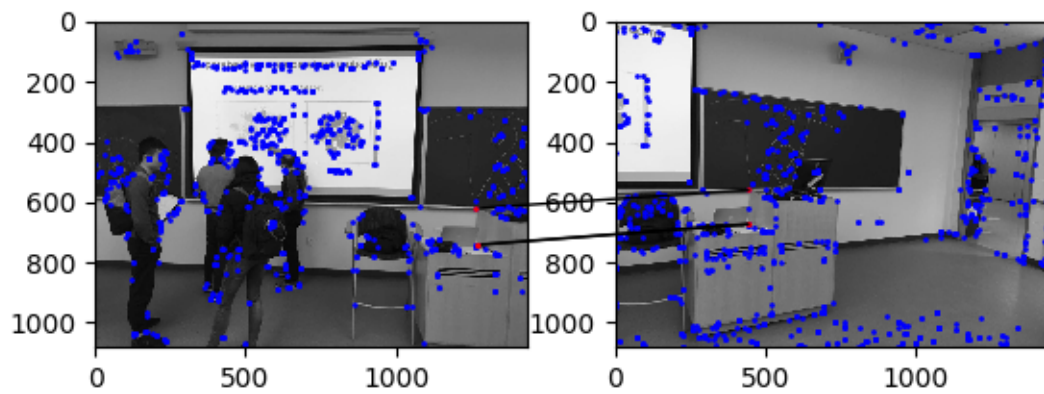

Figure 5: Post-RANSAC points using the middle and right images

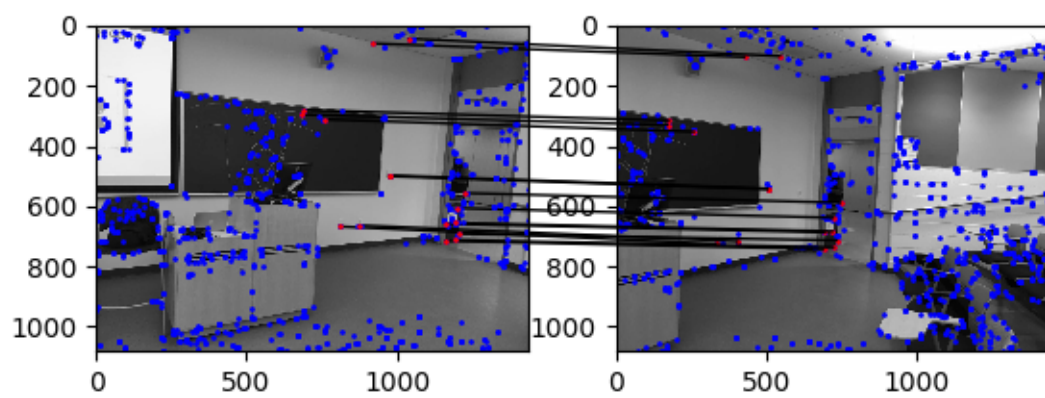

Figure 6: Final panorama
